Environmental action has value. But can we prove it?

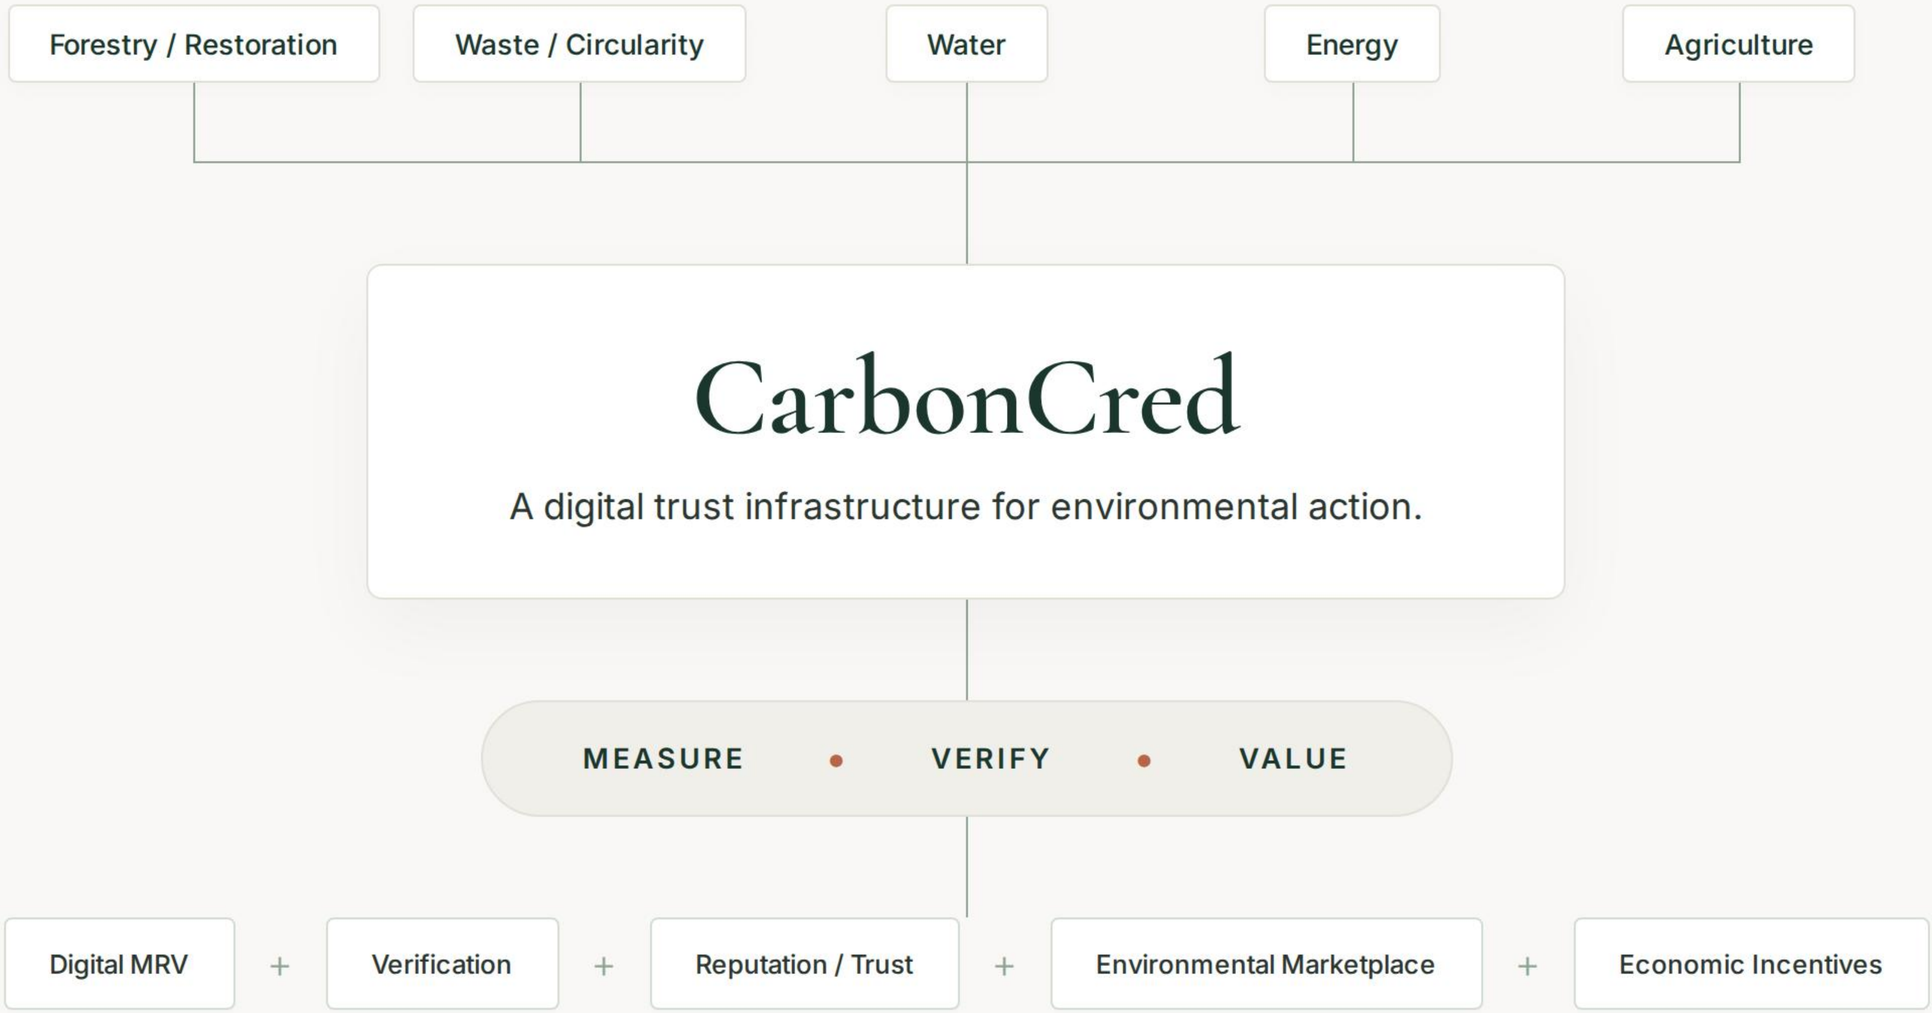

Environmental action is physical.
But evidence, verification and incentives are often fragmented.

MEASURE
What actually happened?

VERIFY
Can the evidence be trusted?

VALUE
Can verified impact create meaningful incentives?

One trusted infrastructure for many forms of environmental action.

From environmental action to trusted value.

STEP 1

Real-World Action

Environmental activity happens: restoration, recycling, conservation, renewable generation, sustainable agriculture, etc.

STEP 2

Measurement

Collect evidence using appropriate sources such as:

- IoT / sensors
- GPS / GIS
- Operational records
- Remote sensing
- Photographic audits

STEP 3

Digital MRV

Measurement → Reporting → Verification.

Standardise and structure the environmental evidence.

STEP 4

Trust & Reputation

Verification creates a traceable record.

Actors, projects and environmental claims build a reputation based on verified performance.

STEP 5

Verified Value

The verified outcome becomes a credible digital environmental asset or claim.

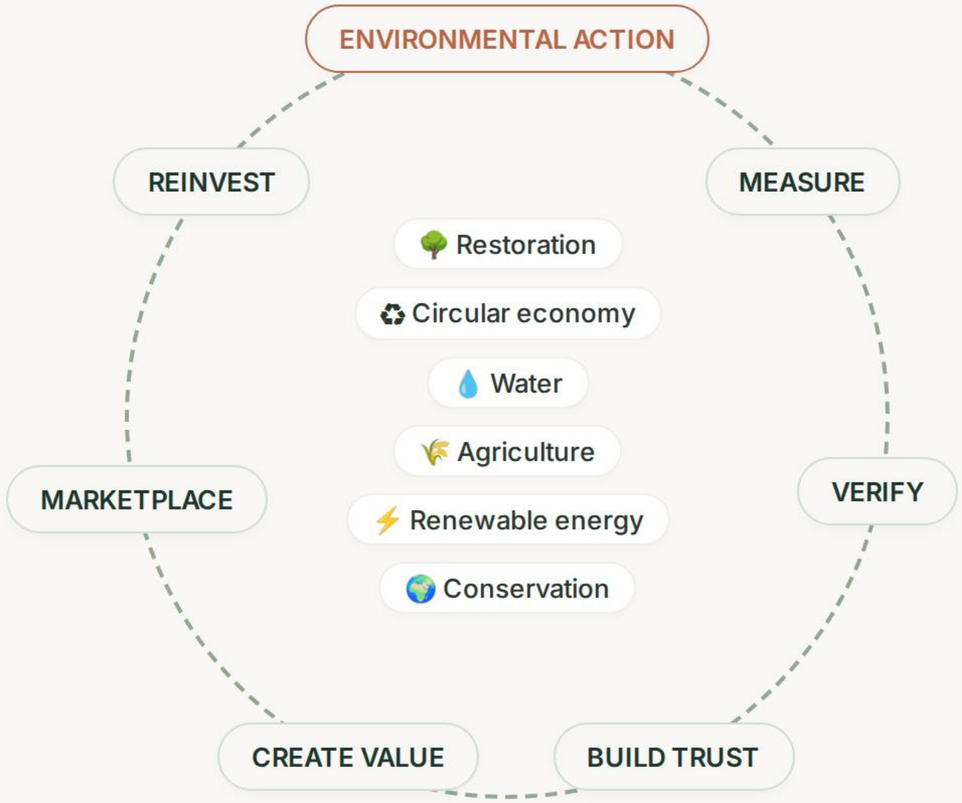

STEP 6

Marketplace & Incentives

Verified environmental value can participate in a marketplace, creating incentives for organisations to support additional action.

MORE VERIFIED ACTION → MORE TRUST → MORE PARTICIPATION → MORE ENVIRONMENTAL INVESTMENT

Make environmental value measurable, trusted and investable.

ENVIRONMENTAL

Better measurement and accountability of environmental outcomes.

ECONOMIC

Create incentives for verified environmental performance.

SOCIAL

Improve transparency and participation across environmental value chains.

TRUST

Reduce uncertainty around environmental claims through evidence and verification.

CarbonCred aims to build the trust infrastructure that allows environmental value to move through the economy.

MEASURE → VERIFY → VALUE → REINVEST
